

Onboarding an Endpoint to Action1 RMM: Agent Deployment and Verification

This walkthrough demonstrates how to onboard a Windows 10 virtual machine to **Action1**, a remote management and monitoring platform.

The goals of this exercise are to practice:

- Creating an Action1 account
 - Installing and registering the Action1 agent on Windows machines
 - Verifying connectivity and endpoint status
 - Running remote commands and remediating vulnerabilities
-

Step 1: Create an Action1 Account

Within the Windows 10 VM:

1. Go to the [Action1 website](#).
2. Register for a free account (supports up to 200 endpoints for free).

3. Log in to the Action1 dashboard for the first time.

Now, the Action1 agent is ready to be installed on the Windows 10 VM.

Step 2: Download the Action1 agent directly inside the VM

Within the Windows 10 VM:

1. After first-time login you will be on the **Getting started with Action1** page. Under step 1, download the Windows agent (.msi).

Getting started with Action1

The first step is to download and install your first Action1 agent - a tiny program that securely connects to Action1 Cloud and allows to manage your endpoint remotely.

1 Download Agent

Download Agent or Copy the download URL to open it on another endpoint and initiate the download there.

Platform	Type	Delivery options	
 Windows	MSI	Download .MSI ↓	Other Options...
 macOS	SH or PKG	Download .SH ↓	Other Options...

Looking for a Quick Start Guide for macOS? [Click here.](#)

2. Double-click the installer to begin setup. Select **Next** and finally select **Install**.

3. Wait for installation to complete (it usually finishes in less than 30 seconds).
4. After installation, press **Windows + R** → type **services.msc** → press **Enter**

5. Locate **Action1 Endpoint Agent** in the list. Status should show **Running**. Startup type should show **Automatic**.

The VM is now attempting to register with the Action1 cloud console.

Step 3: Verify the Endpoint Appears in the Action1 Console

On the host PC, login to Action1 and then navigate to the dashboard:

1. Go to the **Endpoints** tab.

The Windows 10 VM will be visible, displaying the hostname, OS version, and User, etc. Confirm that **Status** shows **Connected**, as this will be crucial for remote administration.

Step 4: Test Action1 Functionality

Once your endpoint appears in the Action1 dashboard and shows **Connected** status, test some of the core features.

☐	Name	Comment	User	Status
☐	Desktop2.SimoTech.com	None	SIMOTECH\Naruto	Connected

A. Test Remote Command Execution

1. In Action1, go to **Endpoints**.

2. Select the Windows 10 VM.

3. Click **Run Script**.

4. In order to run your own scripts, you must first click **Verify Now** and follow the verification steps (takes about 1 minute).

1 Run Script

2 Select Endpoints

3 Schedule

ⓘ To prevent malicious misuse of Action1, your account must be verified by Action1 support before attempting to run custom scripts. However, you can still run built-in scripts from our Script Library. [Verify Now](#)

Script to execute. Insert an ad-hoc script or select a script from [Script Library](#):

Type your script manually or [upload](#) a script file ⓘ

5. For **Script language**, choose **Command - Windows**.

Script language:

Command - Windows

6. Enter **ipconfig**.

Script to execute. Insert an ad-hoc script or select a script from [Script Library](#):

ipconfig

Type your script manually or [upload](#) a script file ⓘ

The script shall exit with exit code 0 on success or non-zero exit code if it encounters any errors.

Initiate a reboot if the script returns any of these exit codes:

Script language:

Command - Windows

6. Click **Next Step**.

Script to execute. Insert an ad-hoc script or select a script from [Script Library](#):

Type your script manually or [upload a script file](#) [?](#)

The script shall exit with exit code 0 on success or non-zero exit code if it encounters any errors.
Initiate a reboot if the script returns any of these exit codes:

Script language:

Command - Windows

▼

Save in Script Library

If you plan to reuse this script in your other actions, it's best to save it in Script Library and reference later

☐ Execute the script above only if the automation condition script returns a non-zero error code

>

Reboot options: automatically, show the message, message timeout 4 hours

Cancel

Next Step

7. Pick the endpoint the script will run on.

1 Run Script

2 Select Endpoints

3 Schedule

The automation will be run on one or more specified endpoints:

Add Endpoints

Remove All

Name	Type	Status	Actions
Desktop2.SimoTech.com	Endpoint	Connected

Finish

Automation "ipconfig" details				
Search...		Status: All		
Endpoint	Operation	Date/Time	Status	Details
Desktop2.SimoTech.com	Start Automation	Dec 6, 2025 12:25 AM	Running	Waiting for the endpoint to run the automation.
1 1 - 1 of 1 50				

10. When the script is done running, the output can be viewed in **Automation History**.

The screenshot shows the Action1 interface with the 'Automation History' section selected. The main content area displays 'Automation "ipconfig" details'. A table lists the automation results for the endpoint 'Desktop2.SimoTech.com'. The operation 'Completed' was successful on 'Dec 6, 2025 12:25 AM'. The 'Details' section shows the output of the 'ipconfig' command, including network configuration for Ethernet adapters.

Endpoint	Operation	Date/Time	Status	Details
Desktop2.SimoTech.com	Completed	Dec 6, 2025 12:25 AM	Success	<pre>C:\Windows\system32>ipconfig Windows IP Configuration Ethernet adapter Ethernet: Connection-specific DNS Suffix . : Link-local IPv6 Address : fe80:cb97:bc0c:24dc:58d9%15 IPv4 Address. : 12.110.4 Subnet Mask : 255.255.255.0 Default Gateway : Ethernet adapter Ethernet 2: Connection-specific DNS Suffix . : Link-local IPv6 Address : fe80:73b9:6230:a0e8:ac98%10 IPv4 Address. : 10.0.2.4 Subnet Mask : 255.255.255.0 Default Gateway : 10.0.2.1</pre>

If successful, the Windows 10 VM’s IP info should be returned from Action1 and displayed in the **Details** section. Remote command execution is functional.

B. Test Vulnerability Remediation

1. Go to **Vulnerabilities**.

The screenshot shows the Action1 dashboard. The 'Vulnerabilities' menu item, represented by a bug icon, is circled in red. Other visible menu items include Dashboard, Endpoints, New Endpoints, Installed Software, and Update Approval.

2. Click the vulnerability and click **Start Remediation**.

Real-time assessment of software and OS vulnerabilities

CVE-2025-62223

Name: Microsoft Edge

CVSS Score: 4.3

Vector: CVSS:3.1/AV:N/AC:L/PR:N/UI:R/S:U/C:N/I:L/A:N

Applied by: Samuel W

Date applied: Dec 6, 2025

Remediation Status: Due later

Remediation Deadline: Jan 4, 2026

Description of manually applied compensating controls:

False positive. CVE-2025-62223 applies only to Microsoft Edge on iOS. Endpoint is Windows, not affected.

Vulnerability remediation is confirmed as functional.

Summary

The Action1 RMM platform was deployed on a Windows 10 virtual machine by creating an account, downloading the Action1 agent directly inside the VM, and confirming that the agent registered correctly in the cloud console. After verifying the service was running, the endpoint appeared in the Action1 console with full system details.

Key features were tested by running a remote command through the Run Script tool and reviewing a reported vulnerability, which was documented as a false positive.

With Action1 now active , remote troubleshooting, vulnerability review, automation, and other administrative tasks can be performed on the endpoint.
